

an activation of the one or more functions at the at least one second device based, at least in part, on a determination that the battery level for at least one first device is below a minimum threshold.

8. A method of claim **1**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

at least one determination on whether at least one first device, at least one second device, or a combination thereof is outside of a range associated with the wireless connection; and

an activation or a deactivation of at least one first device, or at least one second device based, at least in part, on proximity information, temporal information, or a combination thereof.

9. A method of claim **1**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

an activation of the one or more functions at the at least one second device based, at least in part, on a determination that a specific function is unavailable at the at least one first device.

10. A method of claim **1**, wherein the (1) data and/or (2) information and/or (3) at least one signal are further based, at least in part, on the following:

an activation of at least one second device based, at least in part, on targeted communication; and
a notification to at least one first device to cause a synchronization of the targeted communication.

11. An apparatus comprising:

at least one processor; and

at least one memory including computer program code for one or more programs,

the at least one memory and the computer program code configured to, with the at least one processor, cause the apparatus to perform at least the following,

determine contextual information for at least one first device and at least one second device;

process and/or facilitate a processing of the contextual information to determine one or more functions to deactivate the at least one first device;

cause, at least in part, an activation of the one or more functions at the at least one second device;

cause, at least in part, a transfer of the one or more functions from the at least one first device to the at least one second device; and

cause, at least in part, a deactivation of the one or more functions at the at least one first device.

12. An apparatus of claim **11**, wherein the apparatus is further caused to:

cause, at least in part, a presentation of at least one user interface at the at least one first device for controlling the one or more functions transferred to the at least one second device.

13. An apparatus of claim **11**, wherein the apparatus is further caused to:

cause, at least in part, an establishment of a wireless connection between at least one first device and the at least one second device,

wherein the controlling of the one or more functions is performed over the wireless connection.

14. An apparatus of claim **11**, wherein the apparatus is further caused to:

cause, at least in part, a synchronization of data between at least one first device and at least one second device; and

cause, at least in part, a triggering of one or more functions based, at least in part, on the activation command from the at least one first device.

15. An apparatus of claim **11**, wherein the apparatus is further caused to:

determine at least one first device as a primary device based, at least in part, on device capability information, resource availability information, user configuration, or a combination thereof.

16. An apparatus of claim **11**, wherein contextual information includes battery level information, proximity information, user configuration, temporal information, Subscriber Identity Module (SIM) information, status information, or a combination thereof.

17. An apparatus of claim **11**, wherein the apparatus is further caused to:

cause, at least in part, an activation of the one or more functions at the at least one second device based, at least in part, on a determination that the battery level for at least one first device is below a minimum threshold.

18. An apparatus of claim **11**, wherein the apparatus is further caused to:

determine whether at least one first device, at least one second device, or a combination thereof is outside of a range associated with the wireless connection; and

cause, at least in part, an activation or a deactivation of at least one first device, or at least one second device based, at least in part, on proximity information, temporal information, or a combination thereof.

19. An apparatus of claim **11**, wherein the apparatus is further caused to:

cause, at least in part, an activation of the one or more functions at the at least one second device based, at least in part, on a determination that a specific function is unavailable at the at least one first device.

20. An apparatus of claim **11**, wherein the apparatus is further caused to:

cause, at least in part, an activation of at least one second device based, at least in part, on targeted communication; and

cause, at least in part, a notification to at least one first device to cause a synchronization of the targeted communication.

21-48. (canceled)
